

Abstract of the Disclosure:

A device for loading and/or unloading a freight transport compartment includes using at least one conveyer unit that is installed in a loading area, the conveyer unit being capable
5 of conveying in particular several goods units simultaneously. The invention reduces the costs and increases the flexibility of a loading/unloading device by providing the conveyer unit with at least one element that can be guided into the freight transport compartment and that forms a positioning surface for
10 the goods units.
